

Ex. No: 03 Survey report on emerging trends in low code application development

AIM:

To study the emerging trends in low code application development and understand how low code platforms are change the software development process.

Introduction:

Low-code application development allows user to create applications using visual interfaces drag and drop components and minimal hand written code interfaces, drag components and minimal hand written code. It helps organizations develop app application faster and makes application development accessible to user with limited programming experience.

Emerging Tools:

1. AI - Assisted development
⇒ AI is increasingly used to generated code, work flow and application components
2. Mobile application Development
Low-code platforms provide tools for quickly ~~ready~~ responsive mobile applications.
3. Cloud - Based development
Cloud platforms enable application to be developed deployed and manageable online.

4. Workflow automation:

Business use low-code tools to automate repetitive tasks and business process.

5. Integration with API's

Modern platforms provide easy integrate with databases, API and third party services.

6. Citizen development:

Non programmers can build simple business application with minimal coding knowledge.

Fast-development, reduced development effort easier maintain rapid prototyping and improved collaboration between technical and non-technical users.

Result:

The emerging tools in low-code application development were surveyed and their in simplifying and accelerating application development was understood.
